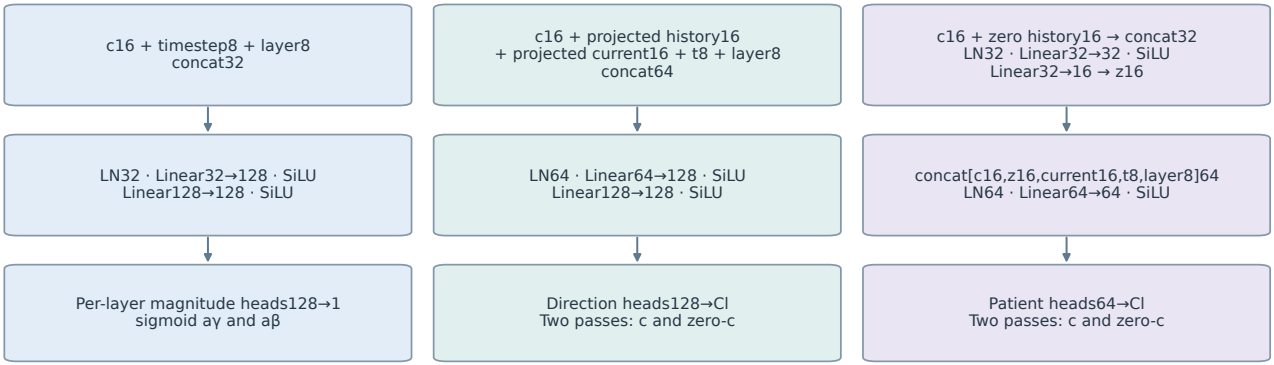
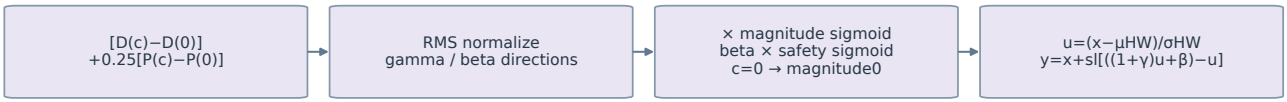
a B14 controller: magnitude, direction and patient residual branches



Cl = 320 / 320 / 640 / 1280. Old raw γ/β heads are computed but discarded by effective().

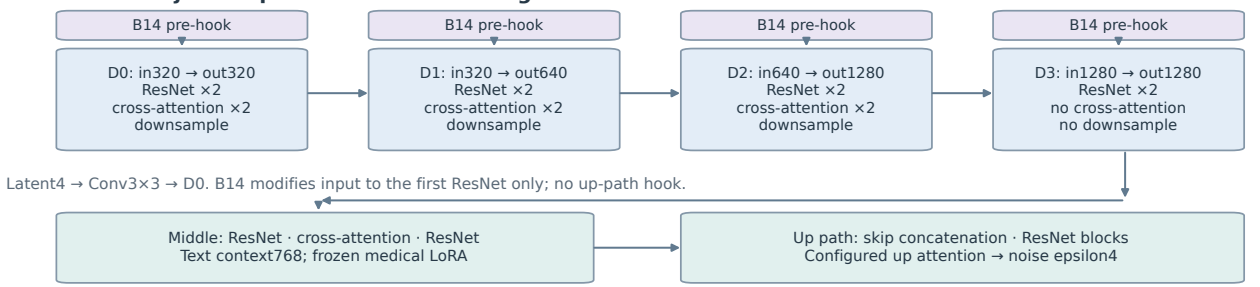
b Zero-referenced direction, bounded strength and residual modulation



sl = sigmoid(learned layer scale). History16=0; current16 = four activation statistics repeated ×4.

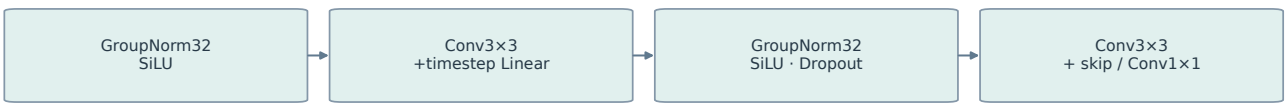
Zero condition preserves x algebraically; condition_scale metadata is not consumed by this hook.

c Effective injection points within the configured SD1.5 UNet



Latent4 → Conv3×3 → D0. B14 modifies input to the first ResNet only; no up-path hook.

d ResNet microstructure and frozen-library provenance boundary



UNet config: channels320/640/1280/1280, two down ResNets/block, cross-attention dim768.

Current installed ResNet sources explain these interfaces; historical library revision is NOT_RECOVERED.

B14 checkpoint: 93 tensors, 1,707,072 parameters; CPU strict schema load, no UNet or clinical forward.
